## A. Comparing Two Long Integers

time limit per test: 2 seconds memory limit per test: 256 megabytes input: standard input output: standard output

You are given two very long integers a, b (leading zeroes are allowed). You should check what number a or b is greater or determine that they are equal.

The input size is very large so don't use the reading of symbols one by one. Instead of that use the reading of a whole line or token.

As input/output can reach huge size it is recommended to use fast input/output methods: for example, prefer to use scanf/printf instead of cin/cout in C++, prefer to use BufferedReader/PrintWriter instead of Scanner/System.out in Java. Don't use the function input() in Python2 instead of it use the function raw\_input().

## Input

The first line contains a non-negative integer a.

The second line contains a non-negative integer *b*.

The numbers a, b may contain leading zeroes. Each of them contains no more than  $10^6$  digits.

## **Output**

Print the symbol "<" if a < b and the symbol ">" if a > b. If the numbers are equal print the symbol "=".

## **Examples**

input		
9 10		
output		
<		

nput	_
1 0	
output	

input	
00012345 12345	
output	
=	

input	
0123 9	
output	
>	

## input 0123

## **Finished**

## → Virtual participation

Virtual contest is a way to take part in past contest, as close as possible to participation on time. It is supported only ACM-ICPC mode for virtual contests. If you've seen these problems, a virtual contest is not for you - solve these problems in the archive. If you just want to solve some problem from a contest, a virtual contest is not for you - solve this problem in the archive. Never use someone else's code, read the tutorials or communicate with other person during a virtual contest.
