# A. Expression

time limit per test: 1 second memory limit per test: 256 megabytes input: standard input output: standard output

Petya studies in a school and he adores Maths. His class has been studying arithmetic expressions. On the last class the teacher wrote three positive integers a, b, c on the blackboard. The task was to insert signs of operations '+' and '\*', and probably brackets between the numbers so that the value of the resulting expression is as large as possible. Let's consider an example: assume that the teacher wrote numbers 1, 2 and 3 on the blackboard. Here are some ways of placing signs and brackets:

- 1+2\*3=7
- 1\*(2+3)=5
- 1\*2\*3=6
- (1+2)\*3=9

Note that you can insert operation signs only between a and b, and between b and c, that is, you cannot swap integers. For instance, in the given sample you cannot get expression (1+3)\*2.

It's easy to see that the maximum value that you can obtain is 9.

Your task is: given a, b and c print the maximum value that you can get.

# Input

The input contains three integers a, b and c, each on a single line  $(1 \le a, b, c \le 10)$ .

#### Output

Print the maximum value of the expression that you can obtain.

## Examples

Examples	
input	
1	
2 3	
output
